Final Project Description:

The final project is two versions of websites.

One is a resume website, and one is a portfolio website.

For the resume website, I made it by using the Github page.

I uploaded my photo picture to the Github issues first to get the correct link.

Then I resized my photo picture by using this code:

Then I set up the insert links by using [ ] and ( ).

After that, I uploaded some photos to the Github issues for background pictures, and all of those were been resized for sure.

Besides it, I built my portfolio website with my two roommates by using WordPress. One of my roommates is a professional WordPress user and she leads us to make this website look professional and organized.

I was in charge of all picture uploading, organizing and editing; one of my roommates was in charge of editing font, and one of my other roommates was in charge of video uploading.

All links in both my resume website and portfolio website work great, videos work well and audios work clearly. The message on the contact page will directly be transferred to my email.

For improvement, I will edit and upload a background picture on my resume website to make it look cooler.
